

Visualisation: (include a legible and meaningful graphic with clear labels and no scientific notation)

Significance: *Explain what your visualisation represents and what are its implications vis-a-vis your [historical] research question (250 words)? Also, consider briefly what your visual does not show.*

My visualisation represents different points in all of Denmark. It is an interactive map, so pressing on one of the points will tell you what it represents - each and every point is something unique. The location is found by using Longitude and latitude, so the location will be exact (if the data is correct at least). The places are picked by students taking this lesson, and represent all sorts of things, like bars, churches, cafes, museums and someone's home. Therefore this map is kind of useless, since it showcases a lot of random things, instead of focusing on one thing. It is simply too broad to say anything meaningful about any topic. For example, If you wanted to go to a museum you would not look at the different points of this map to see where they are - instead you would find a map specifically made for museums.

What my visual doesn't show: When you press on a location it will show you what type of place it is, and also show a short description of the place. However it does not show longitude, latitude (coordinates), star rating from 1-5 and the notes. These are categories that we can find in the data, which means that it could be added if one would like to do that.

Implications to my research question: I had to make a map of Denmark, showcasing places from the google sheet data - i will say the map above succeeds in doing so.
